

The Music Database

A single webpage application

The music database is single webpage application that allows users to login to a system where they can search up songs from a large database and get back the details. Such as artist, album and the year of release. This site is easy and quick to use and allows for a simple way of finding out more about your favourite song!

Supported platforms:

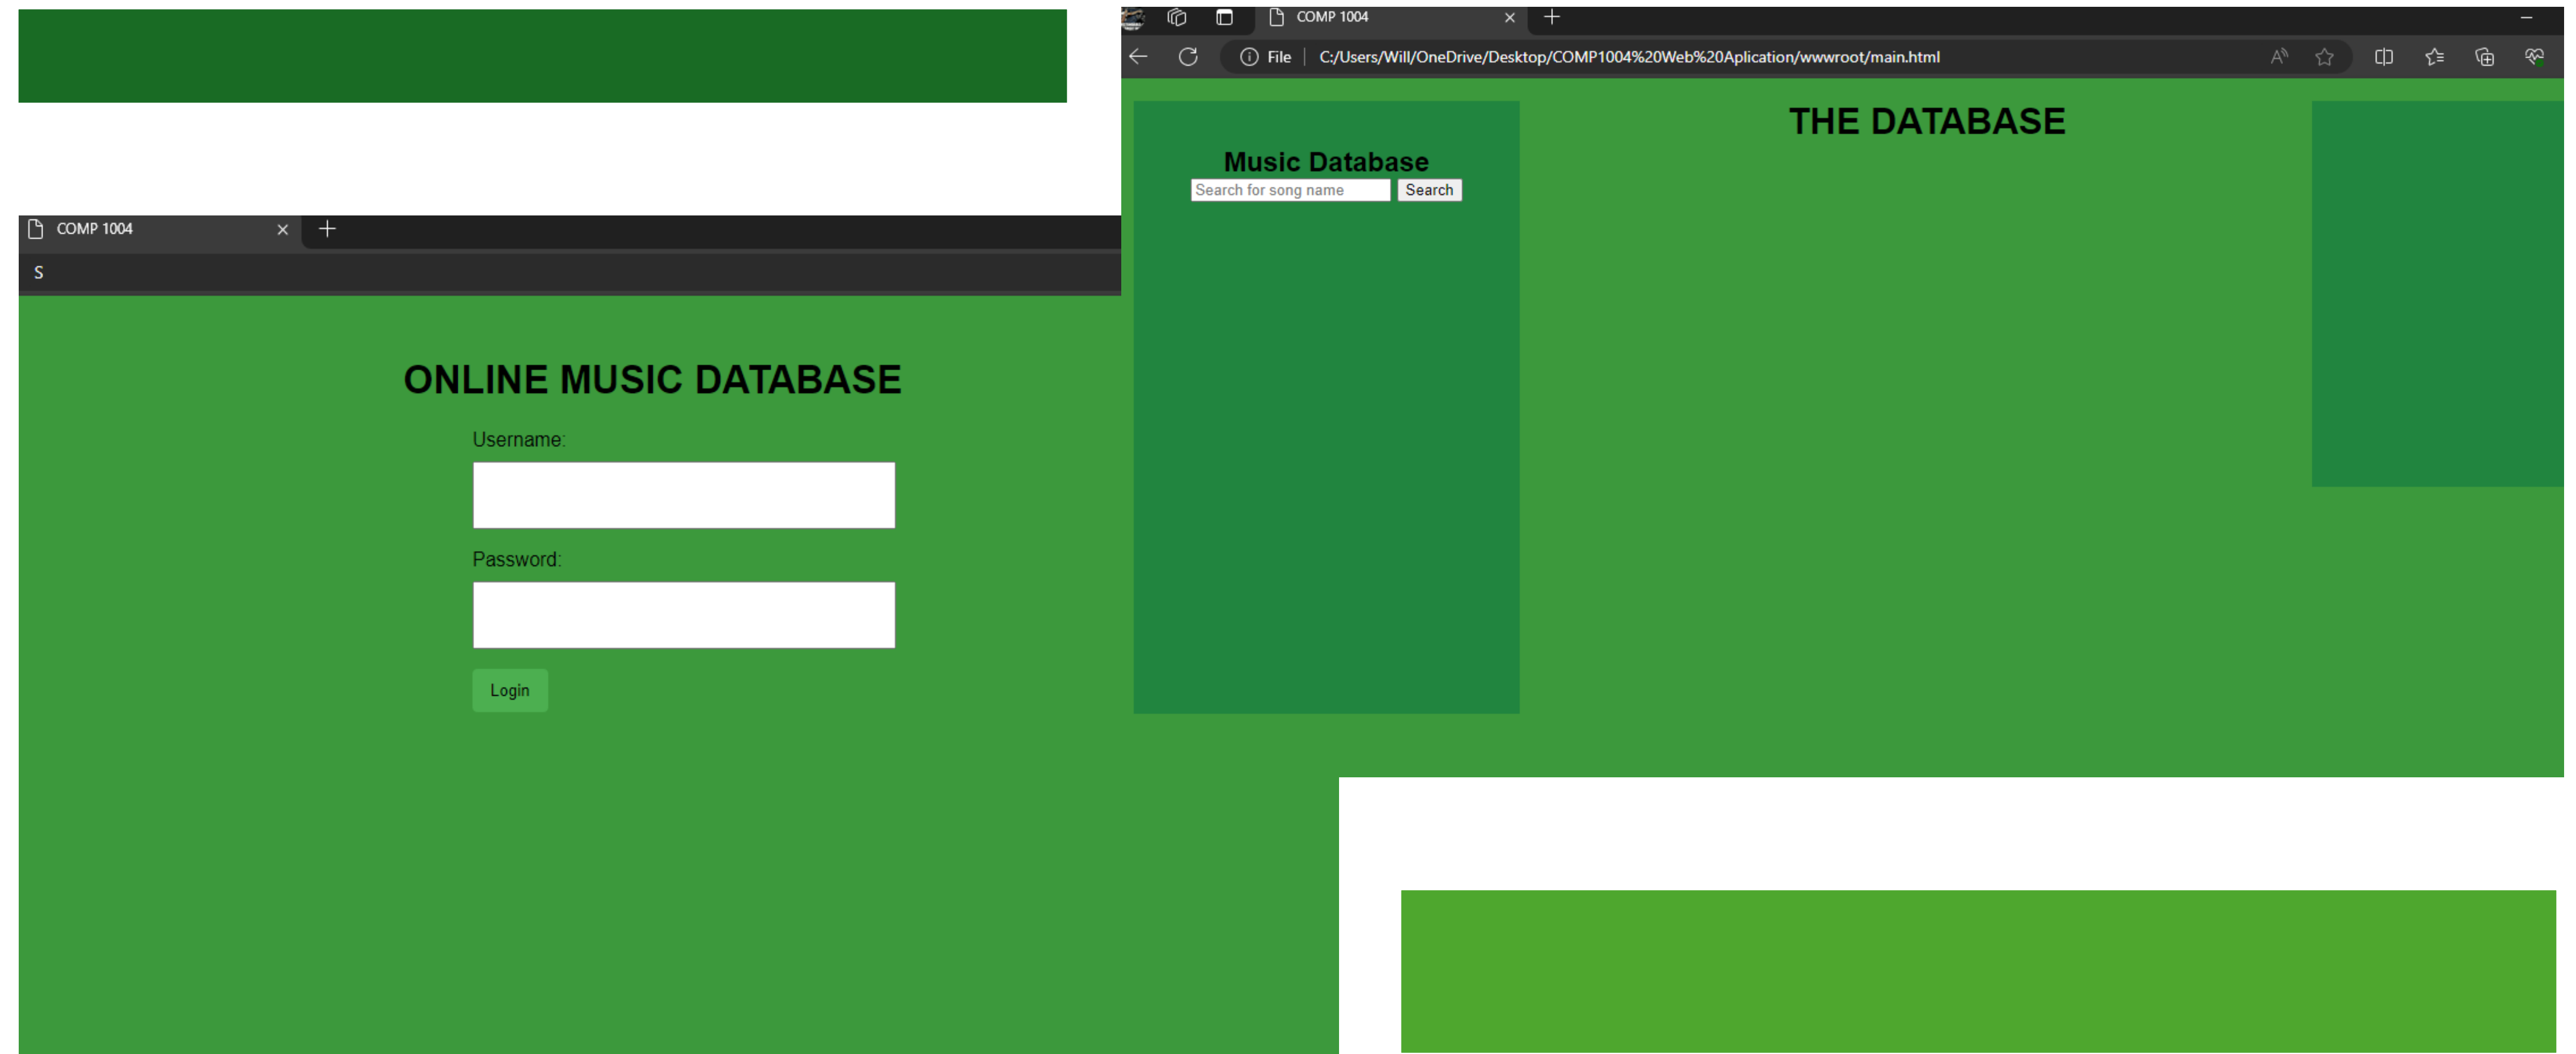

- Computer
- Laptops
- Mobile phones and other peripheral devices.

Supported browsers:

- Microsoft edge
- Firefox
- Opera
- Google chrome

The login system is used so that users can have their unique songs saved, and the history of searched songs. Playlists could be created for uses so that they can easily sort their songs.

The Website:

There is many music platforms out there and trying to filter through all of them to find you favorite song can take time. With all their filters and paywalls/subscriptions, wouldn't it be easier just to have one place to find all your music. This is the purpose of my website, created to be a simple way of discovering music and finding out that little bit more. The website is optimized and accessible to most people and requires no payment or downloading of 3rd party tools. The website is constantly being updated with new songs every time one is added to the API database, so you never miss a new release.
